

Wimbi

Microsoft
TFS™
2010/2011β
Tool

A revolutionary method to customize your products

Manage versions using logical entities instead of physical files

Better target your applications to customer needs through efficient customization. Wimbi creates new versions by integrating features instead of merging files. Transparently transform customer-specific requirements into product builds utilizing Wimbi's symbolic integration. Wimbi enables merging entire Work Items without requiring to individually collect all the Changesets related to these Work Items.

- ✓ Automatic, easy and flexible configuration management
- ✓ Save configuration management and developers time by merging completed Work Items instead of merging Changesets selectively between development branches
- ✓ One click merge using a visual wizard with an overall view
- ✓ Pass (Merge) a single or an entire hierarchical Work Item structure between branches
- ✓ Comprehensive Reports - Tracking passed Work Items using simple Work Item Query Language (WIQL) queries
- ✓ No more lost contents - all Changesets associated with Work Items are tracked and packaged together
- ✓ Work Items can be merged between non related branches (Baseless Merge)
- ✓ The Wimbi is a part of a Microsoft TFS™ Tool environment - no external tools are required
- ✓ Merged content can be validated against the Private Build to ensure merged content does not fail the build
- ✓ The utility is fully customized to ensure an easy and successful implementation
